TTI

31.1 s

Reduce initial server response time Root document took 1,690 ms

Keep the server response time for the main document short because all other requests depend on it. [Learn more about the Time to First Byte metric](https://developer.chrome.com/docs/lighthouse/performance/time-to-first-byte/).

Avoid multiple page redirects Est savings of 940 ms

Redirects introduce additional delays before the page can be loaded. [Learn how to avoid page redirects](https://developer.chrome.com/docs/lighthouse/performance/redirects/).

Avoid large layout shifts 11 layout shifts found

These are the largest layout shifts observed on the page. Each table item represents a single layout shift, and shows the element that shifted the most. Below each item are possible root causes that led to the layout shift. Some of these layout shifts may not be included in the CLS metric value due to [windowing](https://web.dev/articles/cls#what_is_cls). [Learn how to improve CLS](https://web.dev/articles/optimize-cls)

Minify JavaScript Est savings of 4 KiB

Minifying JavaScript files can reduce payload sizes and script parse time. [Learn how to minify JavaScript](https://developer.chrome.com/docs/lighthouse/performance/unminified-javascript/).

Reduce unused JavaScript Est savings of 49 KiB

Reduce unused JavaScript and defer loading scripts until they are required to decrease bytes consumed by network activity. [Learn how to reduce unused JavaScript](https://developer.chrome.com/docs/lighthouse/performance/unused-javascript/).

Page prevented back/forward cache restoration 2 failure reasons

Many navigations are performed by going back to a previous page, or forwards again. The back/forward cache (bfcache) can speed up these return navigations. [Learn more about the bfcache](https://developer.chrome.com/docs/lighthouse/performance/bf-cache/)

Font display Est savings of 150 ms

Consider setting [font-display](https://developer.chrome.com/docs/performance/insights/font-display) to swap or optional to ensure text is consistently visible. swap can be further optimized to mitigate layout shifts with [font metric overrides](https://developer.chrome.com/blog/font-fallbacks).

Forced reflow

A forced reflow occurs when JavaScript queries geometric properties (such as `offsetWidth`) after styles have been invalidated by a change to the DOM state. This can result in poor performance. Learn more about [forced reflows](https://developer.chrome.com/docs/performance/insights/forced-reflow) and possible mitigations.

LCP breakdown

Each [subpart has specific improvement strategies](<https://developer.chrome.com/docs/performance/insights/lcp-breakdown>). Ideally, most of the LCP time should be spent on loading the resources, not within delays.

Network dependency tree

[Avoid chaining critical requests](<https://developer.chrome.com/docs/performance/insights/network-dependency-tree>) by reducing the length of chains, reducing the download size of resources, or deferring the download of unnecessary resources to improve page load.

Render-blocking requests **Est savings of 340 ms**

Requests are blocking the page's initial render, which may delay LCP. [Deferring or inlining](<https://developer.chrome.com/docs/performance/insights/render-blocking>) can move these network requests out of the critical path.

Cumulative Layout Shift **0.701**

Cumulative Layout Shift measures the movement of visible elements within the viewport. [Learn more about the Cumulative Layout Shift metric](<https://web.dev/articles/cls>).

Largest Contentful Paint **4.4 s**

Largest Contentful Paint marks the time at which the largest text or image is painted. [Learn more about the Largest Contentful Paint metric](<https://developer.chrome.com/docs/lighthouse/performance/lighthouse-largest-contentful-paint/>)

First Contentful Paint **2.5 s**

First Contentful Paint marks the time at which the first text or image is painted. [Learn more about the First Contentful Paint metric](<https://developer.chrome.com/docs/lighthouse/performance/first-contentful-paint/>).

Speed Index **2.7 s**

Speed Index shows how quickly the contents of a page are visibly populated. [Learn more about the Speed Index metric](<https://developer.chrome.com/docs/lighthouse/performance/speed-index/>).

Use efficient cache lifetimes **Est savings of 5 KiB**

A long cache lifetime can speed up repeat visits to your page. [Learn more about caching](<https://developer.chrome.com/docs/performance/insights/cache>).

Time to Interactive **4.4 s**

Time to Interactive is the amount of time it takes for the page to become fully interactive. [Learn more about the Time to Interactive metric](<https://developer.chrome.com/docs/lighthouse/performance/interactive/>).
